- (25) Cf. pp. 40 ff.
- (26) Pp. 184 - 186, 214 - 215, 217.
- (27) Cf. F.S.C. Northrop: Science and First Principles, New York, The Macmillan Co., 1931, p. 16: "The third consequence of the mathematical theory is methodological in character. Since mathematical forms are not observed in nature, and, as Plato said, are suggested by, not contained in the world of observation, it follows that one cannot proceed, as did the physical theory of nature, from the facts of observation to one's scientific principles by the necessary relation of formal implication. The facts merely suggest the mathematical forms; they do not imply or contain them. Hence, as Plato maintained, the fundamental scientific method in this theory is the method of hypothesis. Since this method always commits the logical fallacy of affirming the consequent, Plato tries to introduce the dialectic, which is not the vicious thing its modern connotation suggests to certain minds, but the simple sound idea that all hypotheses must be traced to their common presuppositions and unified into a consistent deductive system. When we attempt to do this for psychology and epistemology as well as mathematics and astronomy, we find ourselves face to face with all the problems with which Plato wrestled in his Dialogues. To see the second movement of Greek science in the light of its bearing on first principles is to understand the philosophy of Plato. It was the mathematical and rational character of the inorganic universe that made an idealist in ancient times."

- (53) Whitehead: Science and the Modern World, p. 69. It would be difficult to exaggerate the importance of the discovery of the calculus for the mathematical interpretation of the physical universe. Cf. Randall, op. cit. p. 256: "Such a method of measuring movement and continuous growth Newton discovered; he had arrived at the most potent instrument yet found for bringing the world into subjection to man. Since any regular motion, be it of a falling body, an electric current, or the cooling of a molten mass, can be represented by a curve, he had forged the tool by which to attack, not only the figures, but the processes of nature — the last link in the mathematical interpretation of the world. By its means a Lagrange in the eighteenth or a Clerk-Maxwell in the nineteenth century could bring all measurable phenomena into the unified world of mathematics, and calculate, predict, and control light, heat, magnetism and electricity."

- (61) Throughout this study the phrase "classical physics" refers to Newtonian physics and not to the physics of the Greeks.
- (62) The Mysterious Universe, pp. 111 ff.
- (63) Some authors have attempted to press this continuity to the extent of seeing in the distinctive achievements of recent physics the realization of the main trends in the history of mathematical physics. Cf. Juvet: La Structure Des Nouvelles Théories Physiques, Paris, Alcan, 1933, p. 177: "Les Nombres de Pythagore, les idées de Platon, la mathématique universelle de Descartes, la caractéristique de Leibniz sont de belles anticipations métaphysiques que la nouvelle philosophie naturelle fondée sur les travaux d'Einstein, de Le Roy, de Heisenberg, la mathématique moderne créée par Borel, Pic, Cartan, Heyl confirment et précisent avec l'aide de la méthode axiomatique d'Hilbert. Les ombres et les idées sont les groupes, le symbolisme des axiomes, c'est la Caractéristique Leibnizienne, et les succès sans fin de la mathématique, qui ne se justifient que par la cohérence créée grâce à l'emploi des groupes, font du rêve de Descartes la réalité d'aujourd'hui." He believes that the true nature of the continuity between contemporary mathematical physics and the past is something quite different from what is indicated here by Juvet.

- (76) An Essay on Man, New Haven, Yale University Press, 1944, pp. 211 - 212. This position is developed at great length in his Philosophie der symbolischen Formen, and in Substance and Function.
- (77) Since a number of historians have seen fit to consider the doctrine of St. Thomas as a perversion of the philosophy of Aristotle, it is worth while noting perhaps that we consider Thomism to be in the strictest peripatetic tradition. It would take us too far afield, however, to attempt to establish this point here.
- (78) Our Knowledge of the External World, p. 240.
- (79) Op. cit. p. 40. Cf. Randall, op. cit. p. 236.
- (80) Cf. Science and the Modern World, pp. 15 - 16: "But for science something more is wanted than a general sense of the order of things. It needs but a sentence to point out how the habit of definite exact thought was implanted in the European mind by the long dominance of schol-

astic logic and scholastic divinity. The habit remained after the philosophy had been repudiated, the priceless habit of looking for an exact point and sticking to it when found. Galileo owes more to Aristotle than appears on the surface of his Dialogues; he owes him his clear head and his analytic mind. I do not think, however, that I have even yet brought out the greatest contribution of medievalism to the formation of the scientific movement. I mean the inextinguishable belief that every detailed occurrence can be correlated with its antecedents in a perfectly definite manner, exemplifying general principles. . . . My explanation is that the faith in the possibility of science, generated antecedently to the development of modern scientific theory, is an unconscious derivation from medieval theology."

- (84) Science and the Modern World, pp. 36 - 37. Cf. Adventures of Ideas: Aristotle's Logic "entirely leaves out of account the interconnections between real things. . . . (It) renders an interconnected world of real things unintelligible. The universe is shivered into a multitude of disconnected substantial things. . . . But substantial thing cannot call unto substantial thing. . . . But the Platonic doctrine of the interweaving of harmony with mathematical relations has been triumphantly vindicated. The Aristotelian classifications based upon qualitative predicates have a very restricted application apart from the introduction of mathematical formulae. Indeed, Aristotelian Logic, by its neglect of mathematical notions, has done almost as much harm as good for the advancement of science. We can never get away from the questions: How much -- In what proportions -- and, In what pattern of arrangement with other things." -- pp. 169 - 170, 196.

- (91) Cited by Miezler: Physics and Reality, New Haven, Yale University Press, 1940, p. 119. Cf. Strong: op. cit. pp. 181 - 182: "Galileo treats Aristotle in The Two New Sciences as a predecessor in the inquiry into problems of vacuum, infinity, and continuity, and mechanics. He introduces principles advanced by Aristotle in order to agree as well as disagree with them. In the earlier work, The Two Great Systems of the World, Galileo presents a more impatient Galvanti and a Simplicio who is less of a student and more of a controversialist than in the later treatise. The "Peripatetics" receive the brunt of an attack launched against those who will not receive the evidence of the telescope and the demonstrations of mathematics; but this is not done to convict Aristotle, since Galileo believes that he should have changed his opinion in the light of the new evidence. In neither of his two major works does Galileo present an opposition between Platonic and Aristotelian metaphysics. Aristotle is rather presented in The Two New Sciences as more closely affiliated with mechanical questions than in Plato." In the preface to his Studies on Leonardo da Vinci, Duhem shows that it is a mistake to believe that the science of Galileo is a victory of modern science over medieval philosophy. It is rather a victory of a mechanics that was born in Paris in the fourteenth century and based upon the critical treatment of doctrines derived from Aristotle and Averroes.

- (106) Cf. In II Phys., lect. 11, no. 5.
- (107) This notion of the intrinsic incorruptibility of the heavenly bodies has, of course, been rejected by modern Thomists. But the question of the possible existence of such bodies still remains open.
- (108) In this connection it is interesting to note that in some respects the physics of the medieval Scholastics was more mathematized than modern physics: "Les mêmes conceptions mathématiques se trouvent d'ailleurs dans le détail des théories particulières. C'est ainsi que la doctrine arithmétique classique des cordes vibrantes se complétait au moyen âge par une acoustique musicale entièrement fondée sur les nombres qui définissent les sons. Fait plus remarquable, ces mêmes doctrines pythagoriciennes étaient mises en œuvre dans les théories parallèles de la vue, du goût et de l'odorat. Le blanc, par exemple, était réputé contenir le maximum possible

de lumière, le noir par contre le minimum (De Sensu, VII, 97 - 102, 104, 115. Cf. Ibid. 95, la doctrine qui fait du noir le minimum et non la privation). Toutes les autres couleurs résultaient ensuite d'un mélange en proportion définie de ces deux composantes simples (Ibid., 102) Pour les belles couleurs, dont on ajoutait mélancoliquement, qu'elles étaient aussi rares que les beaux accords musicaux, le rapport des composantes sera une fraction particulièrement simple, pour les vilaines un incalculable (Ibid. 101, 104, avec la théorie mathématique aux 98 - 100) Les qualités perçues par le goût résultent pareillement d'un mélange en proportion définie de deux composantes simples le doux et l'amer. (De Sensu XI, 148). Et l'esthétique se faisant, cette fois gastronomique, on ajoute que les goûts agréables correspondent aux fractions simples, les mauvais goûts aux incalculables. (Ibid. 149) Les odeurs, enfin, qui sont définies par les goûts auxquels elles sont conjuguées, suivent la même loi. (De Sensu, XII, 174 - 176; XIII, 177 - 178) Et sur tous ces points la physique ancienne se montre manifestement beaucoup plus mathématisée que celle des modernes." R.P. Salvan; "La Conception Scolastique de la Physique" in Philosophie et Sciences, pp. 46 - 47.

(109) We believe that M. Maritain has thrown some confusion upon this point; "Cet usage des principes mathématiques dans la connaissance de la nature peut ou bien rester accidentel et représenter un emprunt fait aux mathématiques par le naturalis, ou bien être essentiel à la science considérée, qui est alors proprement une scientia media; et il est clair que divers degrés de 'mathématisation' accidentelle doivent conduire progressivement de la science purement physique à la scientia media. La physico-mathématique des modernes réalise le type de la scientia media d'une façon parfaite. Au contraire nous pensons que l'usage des mathématiques en biologie par exemple ou en psychologie, n'arrivera jamais à subordonner typiquement ces disciplines aux règles d'explication mathématiques." Degrés du Savoir, p. 234 footnote.

(110) Cf. W.R. Thompson; Science and Common Sense, London, Longmans Green and Co., 1937, p. 29: "Eminent men of Science, indeed, maintain that the perfection of scientific synthesis depends on the extent to which it has resolved itself into mathematical concepts. There are, however, vast fields

of Science in which the data seem extremely refractory to mathematical interpretation; where we cannot conceive that they could by any process of distillation or boiling down, be reduced entirely to measurable elements. Science, in its present form, thus presents itself, not as a deliquescent and temporary construction melting to a dead level of mathematical material, but as a solid and ordered hierarchy of different kinds of knowledge: all true, all scientific, but diverse."

(111) "Réflexions sur le problème de l'indéterminisme" in Revue Thomiste, nov. - dec. 1937, p. 394.

(112) La Commens (revised edition) p. 7.

(113) "Et c'est aussi en obéissant à cette même tendance éternelle de l'esprit humain que la chimie s'étonne de la diversité des substances et que cet étonnement, selon le témoignage autorisé de M. Job, constitue le point de départ de cette science tout entière." Meyerson: De l'Explication dans les Sciences, p. 181 - 182. Cf. also Kassai, Paris, Librairie J. Vrin, 1936, p. 18 - 19.

(114) Cf. Cours de Philosophie Positive, Vol. VI, 281; III, 29. Comte taught that the extensive use of mathematics in physics was simply an inexcusable prejudice. Cf. Cours de Philosophie Positive, 3e ed. IV, Appendice Général, pp. 1 - 3. It is also interesting to note that J.S. Mill considered the hope of applying mathematics to chemistry and physiology as something chimerical -- Cf. Meyerson: Le Cheminement de la Pensée, p. 190.

(115) Critique of Physics, London, Benn Paul, Reuch, Rutner and Co., 1931, p. 142.

(116) For a good summary discussion of this point see W.R. Thompson: Science and Common Sense, chapter VI.

(117) One of the simplest examples of how mathematical formulation may serve to throw light upon biological phenomena is indicated by W.R. Thompson in the following lines: "In the simplest cases, such as the cylindrical or spherical form, which we find in a multitude of organic formations, the mathematical formation is instantly made. It might seem, at first sight, that the

sum, at first sight, that the

recognition of a raindrop or an Echinoderm egg as a sphere, or a plant stem as a cylinder, add nothing to our knowledge of these forms. But the recognition of a sphere, for example, implies the knowledge of its mathematical law, as expressed in the equations indicating the order between its quantities, such as $S = 4 \pi r^2$ and $V = \frac{4}{3} \pi r^3$. By the knowledge of the law of its quantities, these are reduced from multiplicity to unity so that the form of the sphere becomes intelligible and we have, in the formal order, a *cognitio per causas*. Furthermore, the mathematical definition of a sphere is the basis of a true deductive argument. Knowing that a cell is spherical, we know that it is something whose surface is smaller for the volume it encloses than any other possible figure; and we see also, looking at the matter from another angle, that it exemplifies the law according to which 'any system of bodies arranges itself in such a manner that the potential energy of the system is a minimum' (E. Edser, General Physics, 1913, p. 290) -- Science and Common Sense, pp. 76 - 77.

- (118) Cf. Thurston: Vectors of Mind, Chicago 1935; Spearman: The Abilities of Man, New York, 1928; Edgeworth: Mathematical Psychology, London 1881, etc.
- (119) It is important to keep in mind that whenever intelligence is studied by any method of this kind, what is understood by intelligence can be known only operationally, that is to say, it can be defined only by a description of the concrete procedures of measurement by which the results have been arrived at.

- (44) Cf. St. Thomas: I, 85, 1 ad 1; In VII Met.; De Trin. V, 2, etc. It is hardly necessary to point out that the student of nature uses individual observations and experiments, but only as a point of departure and as a means to arrive at the common sensible matter.
- (45) Last confusion arises, it must be pointed out that modern authors use the word "metaphysics" in a much broader sense than the traditional Thomistic acceptance of the term. It is now generally employed in such a way as to include philosophy of nature as well as metaphysics. We shall use the word in its strict Thomistic meaning.

- (52) Curs. Phil. I, 1. This point may give rise to a difficulty: a metaphysical definition (actus entis in potentia) seems to be employed in philosophy of nature. The answer is that the word potency has a different meaning when the definition is used in metaphysics and in philosophy of nature. In the latter case, it means the physical potency of matter. In the former it is considered in its general meaning as a principle of being. Every act of a being in potency is necessarily the act of a material thing, but while in reality there is identification, the aspect under which this reality is considered is different.

- (73) It may be true that Aristotle himself never brought out this hierarchical structure as explicitly as St. Thomas. Yet the latter merely clarified what was already implicit in Aristotle's doctrine. That is why we see no point in Mansion's argument when he writes: "On ne voit donc pas ce qui justifie, en bonne doctrine aristotélicienne, l'abstraction mathématique entendue comme un degré spécial d'abstraction. Il faudrait pour cela que les notes quantitatives pussent passer vis-à-vis des autres notes auxquelles elles sont unies dans la réalité physique, une antériorité logique ou métaphysique, qu'Aristote n'a point cherché à établir. Les efforts faits dans ce sens par les scolastiques — Saint Thomas ou d'autres — ne peuvent pas entrer en ligne de compte pour formuler une appréciation concernant la position doctrinale du Stagirite lui-même." - (86) Meyerson makes it clear that the superior immateriality of arithmetic has been quite generally recognized. Cf. Le Charnement de la Pensée, p. 308: "Telle était déjà l'idée de Gauss. 'Nous devons admettre humblement', écrivait-il à l'astronome Bessel, que, le nombre est uniquement le produit de notre esprit, l'espace, même au point de vue de notre esprit, constitue une réalité à laquelle nous ne pouvons a priori dicter complètement ses lois'. Dedekind, dans la préface de son fameux opuscule sur la nature du nombre a vivement insisté sur cette idée de l'autonomie de l'arithmétique à l'égard du réel. Le nombre est 'une conception indépendante des lois pures de la pensée' et 'entièrement indépendant des concepts de temps et d'espace'; les chiffres sont 'des créations libres de l'esprit humain, ils servent de moyen pour saisir plus aisément et avec plus de précision la diversité des choses' (Was sind und was sollen die Zahlen? 52 ed., Brunswick 1923, p. III...). Mais Locke, d'ja jugeait que 'le nombre est la plus simple et la plus universelle de toutes nos idées' (Essai Philosophique, II, Ch. XVI, no. 1), et Hume considérait la géométrie comme moins assurée que l'arithmétique et l'algèbre au point de vue de la valeur apodictique de ses affirmations. (Épistémologie, tr. Renouvier et Pillon, Paris 1876, p. 98)".
- (87) Cf. E. J. Salmer: "La Conception Scholastique de la Physique", in Philosophie et Sciences, p. 37. "C'est-à-dire (les

Philosophie et Sciences, p. 37. "C'est-à-dire (les

anciens) connaissent bien des distinctions: les sciences et les arts, les arts libéraux et les arts serviles, les sciences pratiques et spéculatives, ces dernières diversifiées selon leur degré d'abstraction; mais jamais dans aucun domaine, ils n'ont opposé une "science" à une "philosophie."

- (88) Cf. Maritain: La Philosophie de la Nature: "Toutefois cette vérité capitale était payée chez les anciens, chez Aristote lui-même et chez les anciens scolastiques également, au prix d'une grave faute de précipitation intellectuelle. . . Pour l'optimisme des anciens, qui se portait très rapidement à des raisons d'être quelquefois très hypothétiques quand il s'agissait du détail des phénomènes, philosophie et sciences expérimentales étaient un seul et même savoir, et toutes les sciences du monde matériel étaient des subdivisions d'une seule et unique science spécifique qui s'appelait 'philosophie naturalis'. . . --p. 31.
- (89) Cf. Réflexions Sur L'Intelligence, Les Degrés du Savoir, La Philosophie de la Nature, Science et Sagesse, etc. Cf. also Yves Simon: "Maritain's Philosophy of the Sciences," in The Thomist, Vol. V, pp. 85 - 102.

- (91) Curs. Phil. II, q. I, a. 2.
- (92) Cf. In I Phys. lect. 1, nos. 6 - 8; De Sensu et Sensato, lect. 1, no. 2; De Generatione et Corruptione, Froon, In De Anima, lect. 1 no. 1; In Meteorolog. lect. 1; De Caelo et Mundo, lect. 1; etc.
- (93) The full significance of this statement will be brought out in the next chapter which the question of subalternation will be studied in detail.
- (94) In VI Met. lect. 1, no. 1147.
- (95) Ibid. no. 1165.
- (96) Ibid. no. 1149. Even on this point St. Maritain seems to be anti-Thomistic, for he writes: "Je note, entre parenthèses, que l'étude des premiers fondateurs ontologiques des mathématiques, la philosophie du nombre et du continu,

rentre dans la sphère de la philosophie de la nature, car l'abstraction mathématique, ne portant pas de soi sur l'être réel, ne comporte pas de sagesse dans son ordre propre." -- Degrés du Savoir, p. 92-93. Cf. p. 345. Cf. also La Philosophie de la Nature, p. 91. It is difficult to see how the philosophy of mathematics, the problems of number and continuity fall within the sphere of philosophy of nature, which is the study of things in terms of mobility. Philosophy of nature is, indeed, a kind of wisdom within its own realm, in the sense that the general principles of mobile being which it studies give order to the entire study of natural things, but it is a wisdom only in terms of mobility. May not the source of Maritain's confusion be, at least in part, his substitution of sensible being for mobile being? The Philosophy of mathematics pertains to metaphysics not only for the reason given above, but also because, being wisdom, metaphysics has as one of its functions not only the critique of its own nature, but also of that of all the other sciences.

- (101) Cf. Les Degrés du Savoir, pp. 77 ff., 94 - 95, 352, etc.
- (102) After consistently assigning sensible being as the formal object of the study of nature throughout Les Degrés du Savoir, St. Maritain notes in La Philosophie de la Nature, (p. 113) that as Cajetan explains in his opusculum, De Subiecto Naturalis Philosophiae, the expression ens sensibile is less apt than ens mobile. He still insists, however, that it is legitimate to assign ens sensibile as the formal object. For reasons indicated earlier in this chapter we feel that there is much more involved here than a question of aptness.
- (103) "Maritain's Philosophy of the Sciences" in The Thomist, Vol. V, pp. 90 - 91.

- (104) We proceed here from the important difference that the first definition in so far as it has to do with a living being, is based upon both internal and external experience, whereas experimental scientists with the exception of the experimental psychologists in some cases, have adopted the method of drawing only from external experience even when dealing with living beings. We shall return to this point in chapter VIII. For the moment it is sufficient to note that a difference in the sources of experience employed cannot, obviously, constitute a specific difference between sciences.

- (128) We proceed here from the special case of man, whose future existence could have been demonstrated with apodictic necessity once given the existence of a material cosmos, for here the basis of demonstrability was something extrinsic.
- (129) Cf. St. Th. In De Trinitate, VI, 1: Ex hoc autem quod consideratio naturalis est circa materiam a pluribus dependet, scilicet a consideratione materiae et formae, et dispositionum materialium et proprietatum quae consequuntur formam in materia. Ubiqueque autem ad aliquid cognoscendum oportet considerare plura, est difficilior cognitio: unde in I Posteriorum dicitur, quod minus certa scientia est quae est ex additione, ut geometria ad arithmeticae. Ex hoc vero quod eius consideratio est circa res mobiles, et quae non uniformiter se habent eius cognitio est minus firma, quia eius demonstrationes, ut in maiori parte sunt ex hoc, quod contingit aliquando aliter se habere: et ideo quando aliqua scientia magis appropinquat ad singularis, sicut operativa, ut medicina, alchimia, et moralis, minus possunt habere de certitudine propter multitudinem eorum quae consideranda sunt in talibus scientiis, quae quolibet ei additur, frequenter erratur, et propter eorum variabilitatem.

(130) Cf. St. Thom. In I Eth. Nic. lect. 1.

(131) Cf. infra Chapter III, note

(132) The uniqueness of the method proper to each science does not, of course, exclude the possibility of a general treatise on scientific method, for logic, writes St. Thomas, "trahit communes modum procedendi in omnibus aliis scientiis. Modus autem proprius singularum scientiarum, in scientiis singulis circa principium tradi debet." (In II Met. lect. 5, no. 338) In view of this distinction of St. Thomas, the following assertion of Gilson is at best extremely ambiguous: "An Aristotelian discourse on method is... an impossibility; it is possible to speak only of a discourse on methods." (Op. cit. p. 71) Far from being an impossibility, a discourse on scientific method was actually written by Aristotle, namely the Posterior Analytics.

- (42) Phys. II, 2
- (43) In De Trin., V, 3, ad 6.
- (44) Curs. Phil., Vol. II, 4. I, n. 1.
- (45) In II Phys., lect. 3, no. 8. Many modern authors hold that in this passage St. Thomas is guilty of misreading Aristotle. Maritain, for example, has this to say: "Ici j'ouvre une parenthèse d'ordre historique. Aristote, en réalité, n'a pas dit cela expressément, c'est saint Thomas qui l'a dit en s'appuyant sur un texte d'Aristote pour notre plus grand profit mal compris. Aristote, au livre II de la Physique, chap. 2, 194 a, 7, parle de la connaissance mathématique, et il parle des parties des mathématiques qui sont plus physiques que les autres, qui concernent d'avantage les choses physiques, c'est ce qu'il appelle τὰ φυσικώτερα τῶν μαθημάτων, les traducteurs modernes traduisent à bon droit: "les parties les plus physiques des mathématiques". Saint Thomas, au contraire, dans sa troisième leçon sur le Livre II de la Physique, entend qu'il s'agit non pas des parties les plus physiques des mathématiques, mais de sciences plus physiques que mathématiques, magis naturales quam mathematicae." — La Philosophie de la Nature, p. 36. Cf. also Mansion, op. cit. p. 27. In spite of the fact that a superficial reading of the Greek phrase cited by Maritain might seem to favor his interpretation, we prefer to believe that St. Thomas' reading of Aristotle is correct. There are three reasons. First, the rendition of St. Thomas is not incompatible with the construction of the Greek phrase. Secondly, the Latin translation which Saint Thomas followed was that made by William of Moerbeke, and it is considered

by the most competent of modern critics as extremely accurate. Thirdly, the exactness of the version of St. Thomas is clear from the whole paragraph in which the disputed phrase appears, for in it Aristotle shows precisely that optics, for example, is more physical than mathematical. In order to bring out this last point we give here the whole paragraph in Greek, together with William of Moerbeke's translation:

Ἀλλοὶ δὲ καὶ τὰ δυσικώτερα
τῶν μαθημάτων, οἷον ὀπτική
καὶ ἀρμονική καὶ ἀστρολογία.
ἀνάπαλιν γὰρ τρόπον τιν'
ἔχουσι τῇ γεωμετρίας. Ἀλλ' ἡ
μὲν γεωμετρία περὶ γραμμῆς
δυσικῆς σχοπεῖ, ἀλλ' οὐχ ἡ
δυσιαή· ἡ δ' ὀπτική μαθηματικὴ
μὲν γραμμὴν, ἀλλ' οὐλ' ἡ
μαθηματικὴ, ἀλλ' ἡ δυσικῇ.

"Demonstrant autem et quae magis physica sunt mathematicae, ut perspectiva et harmonica et astrologia: e contrario enim quodammodo se habent ad geometricam. Geometria quidem enim physicam intendit lineam, sed non in quantum est physica: sed perspectiva quidem mathematicam lineam, sed non in quantum mathematica, sed in quantum est physica.

- (46) II - II, 9, 2, et 3.
- (47) Curs. Phil. II, c. I, n. 1.
- (48) Cf. Fulton Sheen: "Every science is constituted of a material and formal object. The material object is what is studied; the formal object is the aspect or the how it is studied. The new mathematical physics is, from the material point of view, a science of the real world, but it soon leaves that concrete, real world to manipulate it in terms of mathematical symbols." — The Philosophy of Science, p. 83.

- (15) "Que si, cependant, on considère les limites de ce qu'on entendait ainsi déduire, on s'aperçoit que Hegel est resté bien en deça de son modèle. Aristote et ses sectateurs au moyen âge, nous l'avons vu à propos de Carsonide, limitaient sans doute la déduction à l'universel, mais ces universaux comprenaient tout ce qui constituait la science, puisque celle-ci ne peut traiter que du genre. Hegel ne déclare déductibles que certains aspects très généraux de la science, tout le reste étant issu de l'arbitraire, de la nature et justiciable seulement de savoir empirique. C'est qu'en dépit de toute son 'arrogance logique', la philosophie hégélienne est obligée de tenir compte de ce fait qu'un énorme acquis scientifique s'interpose entre elle et les derniers sectateurs de la physique péripatéticienne, et que cette évolution lui interdit de pousser sa régression au delà de certaines limites." pp. 476 - 477.

- (65) Cited by Thompson: Introduction to Science, pp. 124 - 125. Cf. also Cohen and Nagel: An Introduction to Logic and Scientific Method, New York, Macmillan, Knickerbocker, and Co., 1934, p. 149.
- (66) Cf. Rey: La Théorie Physique: "La relativité des connaissances physico-chimiques leur permet de croire à côté de ces connaissances à des affirmations au sujet desquelles

la physique est incompétente. Elle ne leur permet pas d'en connaître l'objet." p. 367.

- (67) Principles of the Twentieth Century, New York, The Philosophical Library, 1944, p. 142. Cf. Simple: Through Science to Philosophy: "If, without violating the principles on which physics and biology have developed science can extend its correlations over the whole of experience it will become philosophy." p. 34. Cf. also Whitehead: Process and Reality, Cambridge University Press, 1929, pp. 12 - 13.
- (68) La Philosophie de la Nature, p. 141. We believe that Maritain's error is at least partially due to the fact that he looks upon the whole of philosophy as pedagogically posterior to the experimental sciences. He writes: "Il y a, c'est bien sûr, une forte dépendance matérielle de la philosophie à l'égard des sciences. Tout d'abord, dans la hiérarchie des connaissances la philosophie est comme le tiers culminant, et qui par suite vient pédagogiquement en dernier lieu. — Les Leçons Du Savoir, p. 101. In our opinion the correct pedagogical order of the speculative sciences is as follows: mathematics, philosophy of nature, the experimental sciences, metaphysics. We shall try to explain in chapter VI why mathematics is put in the first place: of all the speculative sciences it has the greatest harmony with the human mind. That is why there are child prodigies in mathematics and not in the other speculative sciences.
- (69) The simplicity and commonness of the experience that is sufficient for philosophy of nature has led some authors to make of philosophy a kind of logic. Thus Professor Watson writes: "The student of philosophy already knows how to speak in the manner that is understood by his fellow in every-day affairs. When he begins philosophy, questions are asked which he can answer without learning new facts about the world... It must be the nature of philosophical problems that their solution does not have to await the becoming of facts. It must be irrelevant to philosophy what actually happens in the world. If this were not so how would philosophy differ from the sciences whose business is with facts." — On Understanding Philosophy, Cambridge University Press, 1938, p. 6. Cf. also p. 21.

that theory plays is so great. Cf. *La Théorie Physique*, pp. 276 - 278, et passim. "L'enseignement de la Physique par la méthode purement inductive, telle que l'a définie Newton, est une chimère. Celui qui prétend saisir cette chimère se leurre et leurre ses élèves. Il leur donne pour faits vus des faits simplement prévus; pour procédés réalisables, des expériences purement idéales; pour lois expérimentales, des propositions dont les termes ne peuvent sans contradiction, être pris comme exprimant des réalités. La Physique qu'il expose est une physique faussée et falsifiée." p. 300.

(86) *Du Cheminement de la Pensée*, p. 463.

(87) Cf. Meyerson: "De plus, exposés dans hypothèses, les résultats expérimentaux nous apparaissent comme quelque chose de définitif, d'achevé, sans que nous apercevions la voie qui y a mené, ni celle qui pourra nous conduire plus loin; car la science n'est pas baconienne, et l'expérience seule, sans le secours de l'hypothèse, ne saurait y mener bien loin. C'est ce qui fait que l'image de la science ou d'une partie de la science que l'on nous offre ainsi sera en quelque sorte statique, alors que la science se trouve en réalité dans un flux perpétuel et dynamique." — *Identité et Réalité*, p. 468.

(88) *Where is Science Going?* p. 97 Cf. Jeans: *The New Background of Science*, pp. 46 - 47.

(89) *Du Cheminement de la Pensée*, p. 45.

(90) Cf. Lindsay and Margenau: *Foundations of Physics*, New York, John Wiley and Sons, Inc., 1936, pp. 4 - 5.

(91) Cf. Cassirer: "Nevertheless it would be a mistake to assume that exact science, owing to this characteristic feature of its concepts, withdraws more and more from the tasks offered by concrete empirical existence. Precisely in this apparent turning away from the reality of things, science is directed upon them in a new way." "They only go beyond the given in order to grasp the more sharply the systematic structural relations of the given." — *Substance And Function and Einstein's Theory of Relativity*, pp. 228 - 229, 126.

(92) Cf. Jules Tannery: *Science et Philosophie*, pp. 322 - 333: "Je pourrais bien ne pas parler de la masse puisque c'est une unité fondamentale et non une unité d'rivée, mais je ne vois aucun inconvénient à ce qu'on définisse la masse d'un corps en décrivant la façon dont on fait une pesée (une double pesée, si l'on veut) au moyen d'une balance. Si l'on équilibre avec des grammes on dira que la masse en grammes est exprimée, ou encore, qu'on a pris le gramme pour unité de masse; c'est la même chose. Quant au 'gramme' il ne me paraît nullement que les élèves pensassent au petit cylindre de cuivre que l'on sait, mais il est bien entendu que pour satisfaire tout le monde on parlera du morceau de platine irradié, etc... en n'oubliant pas, si l'on veut être dans le train, de dire que ce morceau de platine est déposé au pavillon de l'élève, et non aux archives. Je sais bien qu'on offrira au cercle vicieux. . ."

(93) Cf. Eddington: *The Philosophy of Physical Science*, p. 70.

(94) Cf. Eddington: *The Philosophy of Physical Science*, p. 169: "Reference may also be made to another general philosophical system, namely logical positivism. Our insistence that physical quantities are to be defined in such a way that the assertions of physics admit of observational verification, may suggest an affinity with logical positivism. The meaning of a scientific statement is to be ascertained by reference to the steps which would be taken to verify it. This will be recognized as a tenet of logical positivism — only it is there extended to all statements. When it is limited as here to items of physical knowledge, it is in no sense a philosophical tenet; it is only a bringing into line of the language of theoretical and of experimental physics, so that we may not claim the support of observation for assertions which have no observational foundation. If it were a general characteristic of knowledge, it would not be so useful to us in discriminating physical knowledge from other kinds of knowledge. We are therefore not particularly predisposed to favour the more general assertion of logical positivism that the meaning of all non-tautological statements is to be ascertained in the same way, namely by reference to the procedure of verifying them."

- (95) Pp. 1 - 4. Cf. The Nature of the Physical World, pp. 184 - 185: "Our knowledge of the external world cannot be divorced from the nature of the appliances with which we have obtained the knowledge. The truth of the law of gravitation cannot be regarded as subsisting apart from the experimental procedure by which we have ascertained its truth. The conception of frames of space and time, and of the non-emptiness of the world described as energy, momentum, etc., is bound up with the survey by gross appliances. When they can no longer be supported by such a survey, the conceptions melt away into meaninglessness." Et passim. For a detailed analysis of the meaning of operationalism and its implications cf. Percy Bridgman: The Logic of Modern Physics, New York, The Macmillan Co., 1932., and The Nature of Physical Theory. Princeton University Press, 1936.

- (112) Cf. Einstein: The World as I See It, pp. 35 - 36: "The natural philosophers of those days were, on the contrary, most of them possessed with the idea that the fundamental concepts and postulates of physics were not in the logical sense free inventions of the human mind but could be deduced from experience by 'abstraction' — that is to say by logical means. A clear recognition of the erroneousness of this notion really only came with the general theory of relativity, which showed that one could take account of a wider range of empirical facts, and that too in a more satisfactory and complete manner, on a foundation quite different from the Newtonian. But quite apart from the question of the superiority of one or the other, the fictitious character of the fundamental principles is perfectly evident from the fact that we can point to two essentially different principles, both of which correspond with experience to a large extent; this proves at the same time that every attempt at a logical deduction

of the basic concepts and postulates of mechanics from elementary experiences is doomed to failure."

- (113) Cf. Arist: I Anal. Post., 22: "Nam ab effectu qui a pluribus causis procedere potest, non potest una illarum concludi."
- (114) Cf. Poyerson: "Une science privée de théorie apparaîtrait en quelque sorte comme entièrement achevée, statique, alors que la vraie science, nous le sentons, doit être en flux, évoluer, progresser. — De L'Explication, etc. p. 28.

- (132) Experience and Nature, pp. 357 - 358. Cf. also The Quest For Certainty, p. 232: "The doctrine that nature is inherently rational was a costly one. It entailed the idea that reason in man is an outside spectator of a rationality already complete in itself. It deprived reason in man of an active and creative office; its business was simply to copy, to re-present symbolically, to view a given rational structure. Ability to view a transcript

of this structure in mathematical formulae gives great delight to those who have the required ability. But it does nothing; it makes no difference in nature. In effect, it limits thought in man to retraversing in cognition a pattern fixed and complete in itself. The doctrine was both an effect of the traditional separation between knowledge and action and a factor in perpetuating it. It relegated practical making and doing to a secondary and relatively irrational realm."

- (133) Onze Thèses sur Feuerbach, pp. 87, 95. Cf. Jean Languvin: "Sciences et Industrie" in A la lumière du marxisme, p. 114: "La méthode expérimentale, est véritablement active, puisqu'elle consiste précisément à maîtriser ou à modifier les circonstances naturelles. C'est à elle, en premier lieu que s'applique la phrase de Goethe: 'Au commencement de tout, il y a l'action.'"
- (134) Freedom Versus Organization, New York, 1934, p. 192. Nor was Hitler unaware of the essential meaning of Marxism, as the following passage clearly indicates: "Ce qui reste du marxisme, c'est la volonté de construction révolutionnaire, qui n'a plus besoin de s'appuyer sur des équilles idéologiques et qui se forge un instrument de puissance implacable pour s'imposer aux masses populaires et au monde tout entier. D'une tactologie à base scientifique, il sort ainsi un vrai mouvement révolutionnaire, pourvu de tous les moyens nécessaires à la conquête du pouvoir. Et quel est le but de cette volonté révolutionnaire? Il n'y a pas de but précis. Rien qui soit fixé une fois pour toutes. Avez-vous tant de peine à comprendre cela? Nous sommes en mouvement. Voilà le mot qui dit tout...mais nous savons, nous qu'il n'y a pas d'état définitif, qu'il n'y a rien de durable, qu'il y a une évolution perpétuelle. Ce qui ne se transforme pas, c'est ce qui est mort. Le présent est déjà passé. Mais l'avenir est le Rêve inspuisable des possibilités infinies d'une création toujours nouvelles." in Hermann Rauchnig: Hitler M'a Dit, pp. 211 - 214 -- Cited by G. de Koninck. Méthodologie scientifique, 1939, p. 7.

- (8) Lect. 20, no. 574.
- (9) Cf. St. Th. In Met VII, lect. 2, no. 1880: "Et quia posset alicui videri, quod ex quo philosophus ponit omnes modos, quibus dicitur substantia, quod hoc sufficeret ad sciendum quid est substantia; ideo subiungit dicens, quod nunc dictum est quid sit substantia 'solum type', id est dictum est solum in universali, quod substantia est illud quod non dicitur de subiecto, sed de quo dicuntur alia; sed oportet non solum ita cognoscere substantiam et alias res, scilicet per definitionem universalem et logicam; hoc enim non est sufficiens ad cognoscendum naturam rei, quia hoc ipsum quod assignatur pro definitione tali, est manifestum; Non enim huiusmodi definitione tanguntur principia rei, ex quibus cognitio rei dependet; sed tangitur aliqua communis conditio rei per quam talis notificatio datur."
- (10) For other examples cf. Post. Anal. lect. 27, no. 7; lect. 33, nos. 1 - 2; lect. 36, no. 6.
- (11) Cf. III Phys. lect. 8, nos. 1 - 4. When in this passage St. Thomas points out that the arguments of Aristotle for finiteness of bodies are purely dialectical because they proceed ex contrariis, he does not mean common principles such as are found in the second type of dialectical reasoning, but principles that are exactly accepted and hence probable.

- (12) Cf. St. Thomas lect. 2, nos. 24 - 28; cf. also St. Albert the Great; *De Anima*, I, tract. 1, cap. 7: "Physicus autem et dialecticus diffiniunt differenter unumquodque istorum quae dixerunt esse animae opera et passiones. Si enim quaeramus quid est ira, intendentes de diffinitione querere, dicit dialecticus quod est appetitus contrarii doloris, aut aliquid huiusmodi diffiens per intentiones communes formales, quae non sunt vera causa rei propria, sed intentiones communes inventae in pluribus et nulli propriae; et ideo diffinit per formam quae forma de se communis est, et non appropiatur ad esse rei nisi per propriam materiam uniuscuiusque rei. Physicus autem dicit quod ira ascensus vel ascensus et calefactio sanguinis circa cor, tangens propriam causam efficientem quae est ascensus et calefactio sanguinis, et propriam materiam quae est sanguis cordis bulliens, et subiectum quod est cor. Et horum quidam alius reddit materiam propriam scilicet physicus; alius autem reddit speciem et intentionem formae simplicem et communem quae est rei ratio communis. Hic enim considerat rationem sive intentionem communem rei, eo quod non descendit ad propria; ille autem considerat principia realia quae dant esse rei. Necessarium autem est quod ista realia principia sint in materia huiusmodi quae determinata et propria est, si erunt et habent esse in natura."

(21) In his *Commentary on the Topics*, St. Albert the Great brings out the meaning of probability and its connection with dialectics: "Probabilia autem sunt verisimilia. Dupliciter autem verisimilia: aut enim in se sunt verisimilia, eo quod ipsae habitudo praedicati ad subiectum verisimilis est, eo quod nec praedicatum est in subiecto per se, nec subiectum in praedicato per se, nec utrumque in utroque, nec praedicatum necessarium et essentialiter inherens habet cum subiecto, sed verisimile est in dignis non in causis necessariis acceptum. Aut quia necessarium habet inherens, sed non accipitur nisi per signum; et hoc est probabile secundum modum acceptionis, quoniam in se sit necessarium; sicut solus esse majorem terram (eo quod ubique unius quantitatis apparat) probabiliter acceptum est. Solus autem esse majorem terram per quantitatem diatri acceptum est necessarium et non probabile, secundum quod probabile et necessarium opponuntur. Probabile autem sic dictum verisimile est quod per auipsius veritatis figuram videtur omnibus aut pluribus aut sapientibus, et his sapientibus videtur omnibus aut pluribus aut maxime notis et probabilibus; ita quod sapientibus et his vel omnibus sapientibus vel pluribus vel maxime notis vel probabilibus, totum pro uno membro ponatur. "Signa vero verisimilitudinis, aut occurrunt statim in superficie et in exterioribus rei quae accipit sensitiva potentia comparans sonantia ad invicem: et si talia sunt signa, probabile est quod videtur omnibus, sicut nives esse albas per hoc quod nix est parvae partus perspicui in parva conjuncti, in cuius partibus undique lux diffunditur: hoc enim signum sensui est modicum. Si autem signa indicium facientia de verisimilitudine sunt non in superficie, sed aliquantulum profundata, nec ad necessaria, nec in superficie extrinsecus manentia: tunc est id quod videtur pluribus: quia sensui aliquid miscet rationis, sicut quod stella in caelo minoris urinae sit solus, eo quod non descenditur eius singularis notus: hoc autem rationis iudicium sensui est permixtum."

verisimilitudinis profundatur in essentialium et convertibilium causas quae sunt convertibiles sicut causae: tunc est quod videtur sapientibus, sicut est, quod luna moveatur in epicyclo: quia profundum et altius transit per umbram terrae: hoc enim non est causa sed signum.

"Ideo illud quod videtur sapientibus gradus habet, quia aut videtur omnibus, aut pluribus, aut maxime notis vel probabilibus. Quia signum convertibile cum causa, vel apparet mixtus sensui, et tunc videtur omnibus: vel in ipsis substantialibus profundatur, et tunc non videtur nisi probatis et probabilibus sapientibus vel medio est acceptum, et hoc dupliciter. Si enim plus est inclinatum ad sensum: tunc est quod videtur pluribus sapientibus. Si autem plus est profundatur ad necessaria essentialia et intellectualia: tunc est quod videtur maxime notis, qui ex potestate scientiae et artis hoc deprehendere poterunt. Hoc igitur est probabile, ex quo fit syllogismus dialecticus, quod tali et taliter diversificato deprehenditur signum. Haec est sententia commentarii Arabici: et sic scientia demonstrativi et etiam dialectici syllogismorum determinata est." — *Iib. I, tract. I, Th. 2.*

- (22) Indetermination in things may, of course, be a cause of the indetermination in the mind that is proper to opinion, as St. Thomas points out on numerous occasions, but this latter indetermination may also be had when things are objectively determined. Cf. *De Veritate*, XV, 2, ad 3: "Sunt autem quaedam in quibus non est possibile talem resolutionem facere ut perveniat usque ad quod quis est, et hoc propter incertitudinem sui esse; sicut est in contingentibus in quantum contingentia sunt; unde talia non cognoscuntur per quod quid est, quod erat proprium objectum intellectus, sed per alium modum scilicet per quasdam conjecturas de rebus illis de quibus plena certitudo haberi non potest. Unde ad hoc alia potentia requiritur. Et quia haec potentia non potest reducere rationis inquisitionem usque ad suum terminum quasi ad quietem, sed consistit in ipsa inquisitione quasi in motu, opinio non solummodo inducens de his quae inquirunt, ideo quasi a termino suae operationis haec potentia ratiocinativum vel opinativum nominatur." Cf. *ibid. De Anima III, lect. 16.*

- (23) Cf. St. Albert the Great, *In Perihomeneas*, I, tract. II, c. 5, p. 495 b, *Vives T. I.*: "De attende quod licet nomen infinitum nihil ponat et nihil significet, non tamen est vox non-significativa ut britabaf: quia vox non-significativa non excitat intellectum ad aliquid de aliquo intelligendum, sed non-homo excitat ad intelligentiam de hoc quod est privatae qualitatis, quod tamen in rerum natura nihil est, quoniam sit in apprehensione tantum. Et est si ille sicut quando dicimus innominabile, hoc nihil est, et tamen prout cadit in apprehensione per suum oppositum quod est nominabile, ad aliquid excitat intellectum."
- (24) In *I Post. Anal.* lect. 1, no. 6. Cf. St. Albert, *In I Physicorum*, Tract. 1, cap. 5: "Dico autem quod omnis scientia quae habet principia sic procedit, et illa sola est vera scientia: quia est demonstrativa, et effectus solius demonstrationis est scire. Si autem ipsa non habent verum nomen scientiae, tunc ipsa erit scientia topica dialecticae vel rethoricae, et effectus eius non erit scientia, sed opinio. . ."

- (16) In Phys. II, lect. 3, no. 6.
- (17) Substance and Function and Einstein's Theory of Relativity, pp. 19 - 80. Later in the same work (pp. 229 - 230, footnote) he writes: "The 'concrete universality' of the mathematical concepts has also incidentally been recognized and emphasized from the standpoint of Richert. 'The gap for conceptual knowledge between the universal and the particular,' says Leask in his work, Fichtes Idealismus und die Geschichte, and the consequent irrationality is bridged in the mathematical view through the possibility of construction. The individual cases realizing the mathematical concept can be generated by the concept itself. From the concept of the circle, we can attain by construction the mathematical individuality of the particular circle, and thus go from the universal to the individual in its individuality... In mathematics, also, the intuitive object is an individual concrete and given object; but it is given a priori, not a posteriori like the material of sensation it is a logical unique, something individual, but at the same time capable of being construed a priori! We see here also that Richert's criticism would have taken another form if he had conceived the concepts of natural science decisively and from the beginning as products of constructive mathematical, rather than as results of 'abstractive' procedure. The insight once gained for mathematics would have had to be transferred to physics; for precisely here lies the real problem — that mathematics is no 'logical unique,' but that it progressively provides the 'special' natural sciences with its own characteristic form of concept. The form of mathematical 'deduction' is already contained in the form of physical 'induction', by which we grasp the empirically real, and thus the same method of mastery of the particular by the universal is achieved.

- (22) The ambiguity of the word "physical" may give rise to some confusion on this point. We understand it here in its primitive meaning; in which it signifies something pertaining to objective material nature. In the passage which we are about to quote from Eddington it has an entirely different meaning; it designates the world constructed by science. That is why there is no contradiction between Eddington's position and ours. "Writing this chapter on an autumn day, I feel myself in a familiar world whose most prominent characteristic is colour. There is no colour in the physical world. I think that that is the right way to put it. It is true that each colour is represented in the physical world by a number supposed to indicate the length of a wave of some kind. Similarly I am represented at the telephone exchange by a number indicating a hold in a switch-board; but it would not be correct to say that I inhabit the telephone exchange. To put it another way, there is nothing in the accepted description of the physical world which owes its acceptance to the fact that we have a sense of colour. Everything that we assert can be verified by a colour-blind person; and indeed most of our accurate knowledge has been ascertained through the medium of a colour-blind photograph plate." — New Pathways in Science, pp. 11 - 12.
- (23) P. 152. Cf. Whitehead: The Concept of Nature, p. 29: "For natural philosophy everything perceived is in nature. We may not pick and choose. For us the red glow of the sunset should be as much part of nature as are the molecules and electric waves by which men of science would explain the phenomenon. It is for natural philosophy to analyze how these various elements of nature are connected".

- (35) Cf. Planck: The Philosophy of Physics, p. 17: "Once the specific perceptions of the senses as fundamental concepts of physics had been eliminated from that science it was a logical step to substitute suitable measuring instruments for the organs of sense. The eye gave way to the photographic film, the ear to the vibrating membrane, and the skin to the thermometer. The introduction of self-registering apparatus further eliminated subjective sources of error. The essential characteristic of this development, however, did not consist in the introduction of new measuring instruments of steadily growing sensitiveness and exactitude: the essential point was that the assumption that measurement gave immediate information about the nature of a physical event -- whence it followed that the events were independent of the instruments used for measuring them -- now became the foundation of the theory of physics."
- (36) Les Principes de la Physique, p. 16 - 18.
- (37) La Déduction Relativiste, p. 11. Cf. Le L'explication dans les Sciences, p. 184: "Il est manifeste, en effet, qu'aucune propriété physique ne saurait nous apparaître comme réellement motivée par la raison suffisante, qu'au contraire toute qualité dont nous essaierons de doter la matière nous apparaîtra forcément comme une qualité occulte, puisque les propriétés spatiales se révélant comme conformes aux exigences de notre esprit, comme réellement nécessaires. C'est donc que la manière véritablement rationnelle ne peut être au fond que de l'espace." Cf. also Roy: La Théorie Physique, p. 214.

- (38) Sir James Jeans: The New Background of Science, 29 - 31. Cf. Dingle: Science and Human Experience, pp. 81 - 82: "Thus a colour-blind person may not be able to appreciate the full subtlety of Swinburne's observation: 'Those eyes, the greenest of things blue, the bluest of things grey,' but give him a spectroscope and he will discriminate colours by wave-lengths a million times as finely as the eye of the keenest artist. A deaf person cannot distinguish the horrors of modern dance music from the sonatas of Beethoven, but by the use of Lisajou's figures he can detect differences of pitch of which the ear of the most sensitive musician would be unconscious."
- (39) Mind and Nature, p. 15.
- (40) Identité et Réalité, p. 392.
- (41) Cf. Roy: "Pour Poincaré, comme pour le mécaniste, la matière du physicien implique une certaine homogénéité. Ce n'est pas l'homogénéité simple et absolue que la mathématique réclame de son objet, mais elle s'en rapproche indéfiniment comme vers sa limite naturelle. Cette marche vers l'homogénéité explique la possibilité pour la physique de prendre la forme mathématique." La Théorie Physique, p. 186. Cf. also pp. 263 - 265.
- (42) This does not mean that quantity is strictly the subject or the root of the other accidents, but the medium by which they are rooted in the substance. "Accidens non potest per se esse subiectum accidentis, sed unum accidens per prius recipitur in substantia quam aliud, sicut quantitas quam qualitas." I, 77, 7, ad 2. "... subiectum recipit unum accidens alio mediante, sicut corpus recipit calorem mediante superficie, et sic unum accidens dicitur alteri inesse." I - II, 7, 1, ad 5.

- (45) A. 11, ad 10.

- (46) Cf. Meyerson: "C'est, encore une fois, l'accord entre la réalité et la mathématique, plus particulièrement, la géométrie, dont nous avons traité au chapitre précédent, en tant que fondement du panmathématisme. Mais ce que nous devons constater ici, où il s'agit de concepts du sens commun, c'est qu'il n'y a pas seulement accord, mais union, union immédiate et, au fond, indissoluble. Tout ce que notre perception nous présente comme réellement existant assume aussitôt la forme spatiale, et cette forme, nous ne pouvons l'en dépouiller sans atteindre par là l'existence elle-même. . . Existence et spatialité sont donc ici synonymes ou, du moins, inséparables, et c'est là encore un aspect de cette supériorité du panmathématisme en tant que conception métaphysique applicable à la science, que nous avons constatée." De L'Explication dans les Sciences, pp. 576 - 577.

- (49) *Op. cit.* pp. 123 - 125.
- (50) P. 464. Cf. also Rey, *Op. cit.*, pp. 214 - 215. Professor Dewey in the Quest For Certainty explains the significance and fruitfulness of this homogenization of nature from the point of view of instrumentalism: "Physical science disregards the qualitative heterogeneity of experienced objects so as to make them all members in one comprehensive homogeneous scheme, and hence capable of translation or conversion one into another. This homogeneity of subject-matter over a broad range of things which are as disparate from each other in direct experience as sound and colour, heat and light, friction and electricity, is the source of the wide and free control of events found in modern technology. Common-sense knowledge can connect things as sign and thing indicated here and there by isolated couples. But it cannot possibly join them all up together so that we can pass from any one to any other. The homogeneity of scientific objects through formulation in terms of relations of space, time and motion, is precisely the device which makes this indefinitely broad and flexible scheme of

- transitions possible. The meaning which one event has is translatable into the meanings which others possess. Ideas of objects, formulated in terms of the relations and changes bear to one another, having common measures, institute broad, smooth highways by means of which we can travel from the thought of one part of nature to that of another. In idea at least, we can travel from any meaning—or relation—found anywhere in nature to the meaning to be expected anywhere else." In John Dewey's Philosophy by Nature, p. 337.

- (56) "La quantité n'est rien d'original, pas plus matière, étendue ou durée, que grandeur purement logique; elle est une construction conceptuelle, fondée à la fois sur la diversité et l'homogénéité qualitative des contenus de pensée." *Ibid.* p. 379. "C'est la mesure qui crée la quantité."—p. 273.
- (57) Cf. Sir James Jeans: Physics and Philosophy, p. 197.
- (58) Cf. Benjamins: The Logical Structure of Science, p. 117:

"Now as a methodological postulate this can hardly be criticized. But as is often the case in science, a methodological postulate is given the status of a meta-physical judgment. The quantitative aspects of the world are soon looked upon as representative of its essential nature. To explain qualities is to explain them away. To understand them is to be convinced that they are mere appearances. To rationalize them is to construct a system in which they do not function at all as explicit elements. To talk about them is to talk about them vicariously. To grasp them is to realize that they cannot be grasped."

- (65) Cf. Max Planck: The Philosophy of Physics: "The essential characteristic of this development, however, did not consist in the introduction of new measuring instruments of steadily growing sensitiveness and exactitude: the essential point was that the assumption that measurement gave immediate information about the nature of a physical event — whence it followed that the events were independent of the instruments used for measuring them — now became the foundation of the theory of physics. On this assumption a distinction must be made, whenever a

physical measurement takes place, between the objective and actual event, which takes place completely independently, and the process of measuring, which is occasioned by the event and renders it perceptible. Physics deals with the actual events, and its object is to discover the laws which these events obey." pp. 17 - 18.

- (68) Eddington: Space, Time, and Gravitation, pp. 15, 31.
- (69) Cf. Eddington: New Pathways in Science, pp. 12 - 13: "When we have eliminated all superfluous senses, what have we left? We can do without taste, smell, hearing, and even touch. We must keep our eyes — or rather one eye, for there is no need to use our faculty of stereoscopic vision. The eye need not have the power of measuring or gauging light and shade; I think it is sufficient if it can just discriminate two shades so as to detect whether an opaque object is in a certain position or not. . . . In 1915 Einstein made another raid on their sensory equipment. He removed all the retina of the eye except one small patch. The observer could no longer recognize form or extension in the external world, but he could tell whether two things were in apparent coincidence or not."
- (70) Eddington: New Pathways in Science, pp. 2 - 3. Cf. The Philosophy of Physical Science, p. 77, etc. Cf. Bertrand Russell: The Analysis of Matter, p. 6: "All empirical evidence consists in the last analysis of perceptions; thus the world of physics must be, in some sense, continuous with the world of our perceptions, since it is the latter which supplies the evidence for the laws of physics."
- (71) Pp. 69-70. Cf. Lorenz: "The qualitative phase of physics is an essential constituent of even the most highly developed system of physical theory, for the ultimate significance of physical concepts lies in their connection with immediate qualitative experience." — The Nature of Physical

Theory, p. 46.

- (2) L'Evolution Créeatrice, p. 360.
- (3) Cf. Planck: The Universe in the Light of Modern Physics: "The occasion of this development was that extreme refinement in measurement which is an essential condition of the progress of science." pp. 87 - 88. Cf. also pp. 58 - 60; 73 - 74.
- (4) "Je crois que la prédominance de la physique est due principalement à sa méthode. Elle a l'avantage sur les autres sciences d'introduire la mesure le plus loin possible dans ses raisonnements. Tout le secret de sa valeur et de son influence est dans le fait qu'elle est la science de la mesure." — Les Principes de la Physique, p. 19.
- (5) Cf. Eddington: Space, Time, and Gravitation, Prologue, p. 2: "Physicist: 'I really cannot tell you anything about it, if you will not let me make measurements of any kind. Measurement is my only means of finding out about nature. I am not a metaphysicist.'"
- (6) In spite of the numerous criticisms that certain aspects of Eddington's position have evoked, we believe that his fundamental ideas on the relation between physics and measurement are quite correct, and that they represent an opinion that has become generally accepted in recent years, at least among those most competent to assess the true meaning of physical science. He himself writes: "I should like to make it clear that the limitation of the scope of physics to pointer readings and the like is not a philosophical error of my own but is essentially the current scientific doctrine. It is the outcome of a tendency discernible far back in the last century but only formulated comprehensively with the advent of the relativity theory." — The Nature of the Physical World, p. 254.
- (7) The Nature of the Physical World, pp. 252 - 253.
- (8) Cf. Renoult: "La Théorie Physique" in Revue Philosophique, Nov. 1923, p. 383: "Il convient, en effet, de ne

pas s'arrêter aux mots; les noms que l'on donne aux attributs étudiés en physique ont un rapport évident et immédiat avec des hypothèses sur la nature de ces attributs. L'expression 'longueur d'onde d'une lumière' a un sens obvié dans la théorie de l'ondulation et elle ne répondrait à rien dans la théorie de l'émission. Mais elle correspondra toujours à un procédé opératoire par lequel on trouve un nombre-mesure. Quel qu'on imagine sur la nature de la matière, le procédé fera trouver le même nombre; on continuera sans doute à le représenter par λ , mais on préférera l'appeler autrement que 'ci-devant longueur d'onde.'

- (26) Ibid. no. 1945 - 1946.
- (27) It is interesting to compare this doctrine of St. Thomas on the difference between the measurement of number and of magnitude with what has been written on the question by modern philosophers of science, particularly Sir Arthur Eddington: Cf. e.g. The Nature of the Physical World, p. 23: "Number (of discrete individuals) is absolute. It is the result of counting, and counting is an absolute operation. If two men count the number of people in this room and reach different results, one of them must be wrong. "The measurement of distance is not an

absolute operation. It is possible for two men to measure the same distance and reach different results, and yet neither of them be wrong."

- (8) "La science ne se contente pas de formuler les lois d'expérience elle cherche bien plutôt à construire un système logique, reposant sur un minimum de prémisses et comprenant dans ses conséquences toutes les lois de la nature." — Einstein: La Théorie de la Relativité Ed. Louvière, Paris, 1921, p. 109.
- (9) Op. cit. p. 26. In this connection it is interesting to note that in Le Système du Monde, Duhem claims that the Aristotelian doctrine of homocentric spheres was the first physical theory in the modern sense of the word: "Pour la première fois, en effet, dans la constitution de cette théorie, on vit la géométrie partir d'un certain nombre de principes simples qui lui étaient donnés d'en haut et, conformément à ces principes, construire un système mathématique hypothétique, retoucher, compliquer ce système jusqu'à ce qu'il survint avec une exactitude suffisante les apparences observées par les observateurs. Lorsque l'observation eut fait connaître des phénomènes que tout système de sphères homocentriques était, à tout jamais, impuissant à sauver, les astronomes géométriques acceptèrent d'autres principes et, à l'aide de ces nouveaux principes, combinèrent de nouvelles hypothèses; mais la méthode qu'ils suivirent pour construire de nouveaux systèmes astronomiques ne différa pas de celle qui avait servi à édifier le système des sphères homocentriques." — I, p. 128.
- (10) Substance and Function, etc. p. 135.

- (11) Critique of Physics, p. 159.
- (12) Cf. Eddington: "An ideal shines in front of us, far ahead perhaps but irresistible, that the whole of our knowledge of the physical world may be unified into a single science which will perhaps be expressed in terms of geometrical or quasi-geometrical conceptions. Why not? All the knowledge is derived from measurements made with various instruments. The instruments used in the different fields of inquiry are not fundamentally unlike. There is no reason to regard the partitions of the sciences made in the early stages of human thought as irremovable." The Nature of the Physical World, p. 137. Cf. also Einstein: The World As I See It, pp. 33 - 34.
- (13) Op. cit., p. 34. Cf. also Carrigou-Lagrange: Le Sans Commun, La Philosophie de l'Être, p. 70: "Les sciences positives ne peuvent jamais que classer des faits généraux par des hypothèses provisoires (hypothèses représentatives et non explicatives)..."
- (14) Cf. Dantzig: Aspects of Science, p. 231. "The continual use of such terms and phrases has finished by converting them into so many new patterns, and to the extent that they conjure up in the minds of the experts definite physical situations, these weird patterns fulfill their purpose as fully as did the classical mechanical models." Cf. Dirac: Quantum Mechanics, p. 10: "One may extend the meaning of the word 'picture' to include any way of looking at the fundamental laws which makes their self-consistency obvious. With this extension, one may acquire a picture of atomic phenomena by becoming familiar with the laws of the quantum theory."
- (15) Cf. The Principles of Quantum Mechanics, by Dirac.

- (19) Cf. Eddington, The Nature of the Physical World, pp. 158

- 159: "In Bohr's semi-classical model of the hydrogen atom, there is an electron describing a circular or elliptic orbit. This is only a model; the real atom contains nothing of the sort. The real atom contains something which it has not entered into the mind of man to conceive, which has, however been described symbolically by Schrodinger." Cf. Urbain: Les Notions Fondamentales d'Éléments Chimique et d'Atome. Paris, 1925, p. 114: "Cette hypothèse (de Bohr) est exceptionnellement grave. Elle est, en effet, en contradiction formelle avec les lois de l'électrodynamique. Le cas chef, elle peut être qualifiée d'absurde. Si donc les théories étaient faites pour expliquer les phénomènes et donner ainsi à l'esprit la satisfaction de les comprendre, on aboutirait à ce résultat singulier qu'il faut recourir à l'absurde pour faire une théorie cohérente du monde. Mais, comme une pareille manière de voir est tout à fait inacceptable, on doit conclure que les théories mécaniques n'ont d'autre fin que de créer des modèles concrets. Toutes les hypothèses relatives à ces modèles sont acceptables, car, d'une part, le monde idéologique auquel ils appartiennent ne saurait être que conventionnellement restreint aux lois du monde sensible; d'autre part on ne saurait exiger des modèles que de schématiser des faits et de permettre à l'esprit de prévoir d'autres faits par les raisonnements relativement simples qu'ils peuvent suggérer." — Cited by Senoite, Op. cit. p. 158.

(20) Op. cit. p. 159 ff.

(21) Ibid. Louis De Broglie has brought out the true relation between models and mathematics in physical theory: "Une autre conclusion s'impose à nous. Les représentations concrètes ont souvent aidé et aideront encore souvent les théoriciens dans leurs recherches, mais elle constituent en réalité la partie fragile et périssable des théories; ce qui subsiste ce sont les formes abstraites auxquelles ces représentations ont conduit. Fresnel était parvenu à l'équation des ondes en imaginant un éther élastique vibrant. Maxwell et ses continuistes remplacent cet éther élastique par un éther électromagnétique déjà beaucoup moins concret. Einstein et les relativistes abandonnent complètement l'idée d'éther et réduisent la vibration électromagnétique à n'être qu'une pure vibration géométrique dirigée. La nouvelle mécanique, enfin, ne peut plus encore attribuer une nature physique précise aux ondes qu'elle

envisage, et cela ne l'empêche nullement de se développer. Le véritable but de la physique théorique paraît donc être de découvrir et d'étudier les formes mathématiques dans lesquelles les phénomènes physiques peuvent venir se loger. Assigner ce rôle à la physique théorique, c'est sans doute faire participer cette science à la rigueur des mathématiques, mais c'est aussi lui marquer ses limites: derrière l'harmonie que nous révèle la possibilité de couler les faits dans des moules analytiques se cache une réalité dont l'essence nous demeure prodigieusement inconnue." - (27) Cf. Duhem: "En exigeant que les opérations mathématiques par lesquelles les postulats produisent leurs conséquences aient toujours un sens physique, on impose au géomètre d'insupportables entraves qui paralysent toutes ses démarches; avec E. Hobin, il en vient jusqu'à redouter l'emploi du calcul différentiel; en fait, s'il se piquait de satisfaire sans cesse et scrupuleusement à cette exigence, il ne pourrait presque plus développer aucun calcul; des ses premières pas, la deduction théorique se trouverait arrêtée. Une idée plus exacte de la méthode physique, une plus juste détermination entre les propositions qui ont à se soumettre au contrôle des faits de celles qui en sont dispensées, rendront au géomètre toute sa liberté et lui permettront d'user, pour le plus grand développement des théories physiques, de toutes les ressources de l'algèbre." op. cit. p. 316.
- (28) Cf. Milhaud: Le Rationnel, p. 105: "Comment nier que la science tire le plus grand profit de notions fictives, invérifiables, de pur art, sur leur nature, sur leurs implications

ordinaires de détermination des choses..., car, en mathématiques, chaque symbolisme introduit par généralisation précède dans les cas où en vertu des conditions premières, il cessait de rien représenter? Et ce ne sont pas seulement des notions fictives qui peuvent nous servir, ce sont parfois des vues manifestement absurdes." Cited by Meyerson: In Châtiement de la Pensée, p. 368. Cf. A. N. Thompson: Science and Common Sense, p. 87. Obviously fictitious entities can serve as an explanation only if the explanation be conceived as not being definitive, nor ontological nor proper. Cf. Meyerson: "Il nous semble aller en quelque sorte de soi que la véritable explication soit en même temps une explication réelle, par ce qu'il y a au-dessous du phénomène, par ce qui est. Seule, les habitants d'un monde d'aliénés, dit avec raison Hartmann, pourraient tenir ces explications physiques à l'aide de concepts scientiellement irréels." - (48) Cf. Alexian: Physics and Reality, p. 91: "The world of your physics is finished before it begins — an accomplished work extended in time, a realm of established laws, natura naturata. . . Your world is the plane of actuality. Your laws relate actualities to one another. They are verified

by experience in a ^{detected} structure ~~created~~ by the anonymous observer from the totality of phenomena. Its content is the behavior of classes and aggregates. So far as certain conditions prevail — and they do prevail in your large scale inorganic world — the plane of actuality is governed by your sort of physical laws. Hence your straight-telling actuality. But the plane of actuality is not the entire body of reality. Reality embraces both actuality and potentiality, the surface and the depth. . . ."

- (49) Leçons de Direction de l'Ingénieur, edit. Adam et Tannery, pp. 426 - 427.
- (50) Cf. Bertrand Russell: Principia and Logic, pp. 80 - 94: "Modern science, by directly banishing from mathematics the use of infinitesimals, has at least shown that we live in an unchanging world, and that the arrow in its flight is truly at rest. . . . As regards motion and change, we get similarly curious results. People used to think that when a thing changes, it must be in a state of change, and that when a thing moves, it is in a state of motion. This is now known to be a mistake. . . . we may now indulge the comfortable belief that a body in motion is just as truly where it is as a body at rest. Motion consists merely in the fact that bodies are sometimes in one place and sometimes in another, and that they are at intermediate places at intermediate times. Only those who have waded through the quagmire of philosophic speculation on this subject can realize what a liberation from antique prejudice is involved in this simple and straightforward accomplishment."

- (68) Cf. Northrop: Whitehead's Philosophy of Science, p. 167. Cf. also Hixler, op. cit. p. 48: "If I am not mistaken there is some confusion about causality. Many of you, it seems to me, mix up the principium rationis with the law of causality. Each ought to be kept distinct. The principium rationis binds reason and sequence. When you draw your conclusions in the realm of your mathematics you are inclined to call reason the thesis to start from — say, a given triangle having a right angle. From this you proceed to the Pythagorean proportion of the squares, speaking of consequence. In doing so you refer rarely to the process of your thinking. You may also start from the squares and conclude that the angle is a right angle. Then reason and consequence exchange places."
- (69) I, 44, 1, ad 3.
- (70) "Ainsi, il est impossible d'en douter, la diversité dans l'espace constitue pour nous une énigme, un sujet d'étonnement d'essence sinon identique, du moins très semblable à celui que nous découvrons dans la diversité dans le temps, et dès lors nous ne pouvons échapper à cette conclusion que si nos raisonnements sont exacts, le but vers lequel tendent explication et théorie consiste réellement à remplacer ce monde infiniment divers qui nous entoure par de l'iden-

tique dans le temps et l'espace, lequel, évidemment, ne peut être que l'espace lui-même."—Meyerson, De l'Explication dans les Sciences, p. 186.

Stebbing: Philosophy and the Physicists, p. 28 - 29: "Given this exclusion, then the sounds of a Beethoven sonata could be replaced by a series of curves or a set of mathematical formulae. By studying these formulae we might discover that Beethoven was a mathematician."

matician. We should not be able to discover that he was a musician because we have replaced the sounds by the mathematical expressions by means of which they could be mathematically but not musically described. To discover that musician we need further what Jeans would no doubt call musical concepts. But it then becomes impossible to maintain that the universe is God's mathematical thoughts or God thinking mathematically. Perhaps the source of the confusions into which Jeans falls lies in the fact that he believes both that a mathematical description of a phenomenon can give complete knowledge of the phenomenon and also that the phenomenon is indeed an appearance of an unknown reality."

- (16) We believe that J. Maritain has misconstrued Eddington's doctrine on this point: "Eddington paraît oublier ici que non seulement les mesures recueillies dans la nature par nos appareils nous livrent quelque chose de réel (qui peut sembler une 'ombre' au regard de notre univers familier, le philosophe cependant sait que ce sont autant de points d'émergence par où un aspect des choses existant en soi nous apparaît), mais encore que le premier degré ou le premier temps de conceptualisation, parfois très élaborée, où nous dégageons de ces mesures une description du comportement observable des choses nous est aussi en présence de réalités — je dis observables et mesurables, et prises précisément comme telles, — nous introduit dans un monde de faits, de causations observables et de structures observables que le physicien théoricien a tendance à tenir pour une simple matière offerte à son génie constructeur, mais dont le physicien de laboratoire n'est pas disposé à laisser s'écarter qu'il font déjà authentiquement partie de la scène physique elle-même. Ces faits peuvent être établis d'une manière plus ou moins certaine ou plus ou moins hypothétique, ils peuvent impliquer à un degré ou à un autre un achèvement idéal du réel par la raison, ils n'en ressortent pas moins à l'ordre de l'être réel. Des notions comme celle de la constitution des gaz par des molécules individuelles en agitation sans fin, ou de la structure réticulaire des cristaux, et une foule de notions semblables, doivent être tenues pour autre chose que des symboles, — je dis en tant même que traductions du mesurable et de l'observable et avant que l'effort théorique, en s'appliquant à approfondir leur signification et à découvrir, dans une explication complète, de quoi elles nous parlent, nous permette de comprendre qu'elles nous livrent quelque chose de réel." — dernière analyse nous ne savons

que symboliquement de quoi elles nous parlent. Mais c'est précisément ce second degré ou ce second temps de conceptualisation scientifique que P. Eddington a en vue; et là il serait téméraire de refuser son témoignage." — Les Régions du Savoir, pp. 314 - 316.

Eddington: New Pathways in Science, p. 315: "In Rossetti's poem the Ploosed Lamosel looked down from the golden balcony of Heaven across 'The void, as low as where this earth spins like a fretful midge,' looking from the abode of truth, perfect truth alone can enter her mind. She must see the world as it really is..." Cf. The Mathematical Theory of Relativity, p. 1; The Nature of the Physical World, p. 225. Cf. also M. Brunschwig, Le Progrès de la Conscience, 702: "Jamais n'est apparu aussi chimérique l'espoir, que l'homme réussisse à forcer la barrière de l'expérience humaine et qu'une fois de l'autre côté il aperçoive les choses à la manière dont on suppose que Dieu les contemple dans son éternité". — Cited by Meyerson, Du Châinement de la Pensée, p. 589.
- (2) Cf. Eddington: The Philosophy of Physical Science, pp. 157 ff.
- (3) Le Songe de Descartes, p. 63.
- (4) Cf. Eddington: New Pathways in Science, p. 45: "We must concede therefore that 'the universe as it is conceived in modern physics' is not identical with what a philosopher would call 'the objective physical universe.' When we come to think of it there is no reason why it should be. The task of physical science is to disclose the scheme of the recurrences in the combined experience of conscious beings. We have seen that the universe which constitutes the solution of this problem must necessarily have the characteristics of regularity and externality; we said nothing about objectivity. And so it happens that the aim of science and the search for an objective universe follow the same road up to a certain point and then part company."
- (5) Cf. Planck: The Universe in the Light of Modern Physics Pp. 11 - 12: "As soon as contact with reality has been lost, physical law ceases to be felt as the relation between a number of magnitudes which have been ascertained independently of one another, and becomes a mere definition by which one of these magnitudes is derived from the others. In this method there is a particular attraction, due to the fact that a physical magnitude can

be defined far more exactly by means of an equation than by means of measurement. But at the same time, this method amounts to a renunciation of the true meaning or sagacity; while it must also be remembered that confusion and misunderstanding result when the same name is retained in order to denote a changed meaning."

- (6) Cf. Cohen: Reason and Nature, p. 277: "But this fails to explain why phenomena seem to occur as if the law of gravitation with its inverse squares were true, or why the properties of circular functions have proved most potent instruments for the discovery of important facts in almost all branches of physics. Doubtless equations are not vibrating strings; but is it not straining the dualistic dogma to assert that they have nothing in common with each other? Do not let us be misled by the terms 'expedient' or 'invention'. A map or a chart is an expedient or invention. Yet if it fairly represents its objects, is it not because certain relations between its parts are precisely those between corresponding parts of the objects represented? - (7) Cf. de Sitter: Space, p. 6.
- (8) The Mathematical Theory of Relativity, p. 3.
- (9) Eddington rightly objects to Professor Peabbling's contention that physicists are not concerned with chairs; "Physicists are not concerned with chairs! Are we really expected to take this sitting down? . . . Why is it that a Transport Company, wishing to improve its arrangements for seating, consults a physicist who is not concerned with the chairs we sit upon, instead of a philosopher who is?" The Philosophy of Physical Science, pp. 156 - 160.
- (10) Cf. e.g. Eddington: The Nature of the Physical World, and The Philosophy of Physical Science.
- (11) Cf. Jeans: The Mysterium Magnum, pp. 70 - 71: "It may be well to state one essential advance. It

is, in brief, that the ethers and their undulations the waves which form the universe, are in all probability fictitious. This is not to say that they have no existence at all: they exist in our minds, or we should not be discussing them; and something must exist outside our minds to put this or any other concept into our minds. To this something we may temporarily assign the name 'reality', and it is this reality which it is the object of science to study. But we shall find that this reality is something very different from what the scientist of fifty years ago meant by ether, undulations and waves, so much so that, judged by his standards and speaking his language for a moment, the ethers and their waves are not realities at all. And yet they are the most real things of which we have any knowledge or experience, and so are as real as anything possibly can be for us."

- (20) Cf. John of St. Thomas: Ars Logica, p. 681 b: "...non aliter signatus representat quam prius ac ut obiectum representans, ulterius extendendo representationem sui ad aliud in se virtualiter implicitum et contentum."
- (21) In I, 55, 3, no. 13.
- (22) Curs. Phil., Ars Logica, p. 692 b.
- (23) Cf. John of St. Thomas, loc. cit. p. 647 a: "Ratio signi formaliter loquendo non consistit in relatione secundum dici, sed secundum esse."
- (24) Cf. Eddington: The Mathematical Theory of Relativity, Introduction.
- (25) Cf. Paturel: La Théorie Physique, p. 452: "Pourquoi donc le physicien peut-il, sans prêter à rire, affirmer que l'expérience découvre une certaine loi parce que sa théorie réclame la réalité de cette loi, tandis que le

conchyliologiste serait ridicule si la seule présence d'une case vide dans ses tiroirs, consacrés aux diverses couleurs du spectre, le menait à conclure qu'il y a des coquilles bleues dans l'Océan? C'est que visiblement, la classification de ce collectionneur est un système purement arbitraire, qui ne tient aucun compte des affinités réelles entre les divers groupes de mollusques; tandis qu'en la théorie du physicien, transparaît comme le reflet d'un ordre ontologique."

- (26) Op. cit. pp. 265 - 266.

- (12) In I Met. lect. 10. no. 158.
- (13) "Réflexions sur le problème de l'indéterminisme" in Revue Thomiste, 1937, p. 396.
- (14) Cf. Fulton Sheen: Philosophy of Science, p. 76: "The problem whether science has a real value is much like a modernization of the Scholastic dispute of whether an idea is an *id quo* or an *id quod*. In modern language this means, do mathematics have a relation to reality or are they only a mathematical symbol? The modern idealist would hold that scientific knowledge is "that which is known" instead of that "by which" reality is known. St. Thomas' criticism of the subjective theory of knowledge is therefore quite to the point."
- (15) "We must therefore remember that not all our knowledge of the physical universe is comprised in knowledge of the laws of nature. The warning is not so superfluous as it seems. I have often found an impression that to explain away the laws of nature as wholly subjective is the same thing as to explain away the physical universe as wholly subjective. Such a view is altogether unfounded." Op. cit. p. 15. Cf. also pp. 194, 178, 217, etc.
- (16) Cf. e.g. du Cheminement de la Pensée.
- (17) Cf. Meyerson: La Méduction Relativiste, pp. 134, 143.
- (18) De L'Explication Dans Les Sciences, pp. 526 - 528.
- (19) "La science est réaliste; mais nous savons cependant que d'explication en explication, elle ne peut aboutir qu'à l'accomplissement, à la destruction de la réalité. Or, dans la relativité, précisément parce qu'il constitue, une forme très avancée, très parfaite, de l'explication théorique, ces deux extrêmes de l'existence et de la non-existence se trouvent très rapprochés l'un de l'autre. Il y a une sorte de conflit douloureux dans la conscience du physicien." -- Meyerson: La Méduction relativiste, p. 205.
